a A two-stream network whose magno input matures

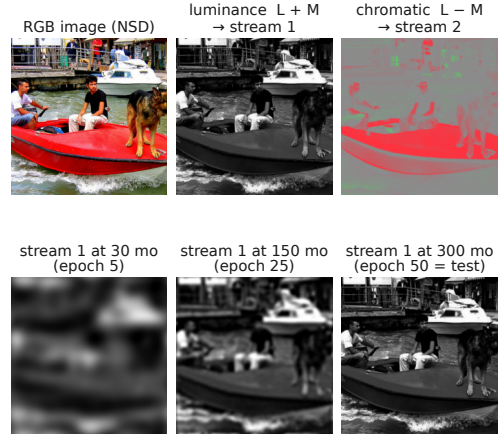

networks compared

	stream 1 trains on	recipe
model	luminance + diet maturing 0 → 300 mo	50 epochs
control	luminance + 300-mo diet from step 0	50 epochs
BA network	luminance + blur σ 4 px + CS at 48 mo	thesis, 150 ep.
BA, no diet	luminance	thesis, 150 ep.

stream 2 trains on L − M in every network; the model and control are tested on the 300-month endpoint

b What stream 1 sees as the diet matures

c The trajectory costs accuracy, not stability
